

AI LANGUAGE DETECTION TOOL

**This is an evolving AI-based language detection system
(technically a deep ANN)**

ICDST AI language detection tool is a free online artificial intelligence tool designed to detect the language of a given text in more than 300 languages. Language detection is used for text-based knowledge classification and to study multicultural and multilingual data by finding the deep relationships that exist between language nodes with different roots.

This is only for trial and therefore supports texts with lengths up to 300 characters. You can purchase a fully functional API version of this service from [here](#).

Please enter text below. For better detection, type at least 75 characters. Over 300 languages and dialects are supported!

Enter text for language detection
